Reply to Office Action dated: 3/18/05

Response dated: 07/08/05

**PATENT
PU010200****REMARKS**

In the Final Office Action, the Examiner noted that claims 1, 3-10, 12-21 and 23-24 are pending in the application and that claims 1, 3-10, 12-21 and 23-24 stand rejected. By this response claims 25-28 have been added and claims 1, 9, 12, 13 and 15 have been amended to correct formality errors pointed out by the Examiner and to more clearly define the Applicant's invention and not in response to prior art. All other claims are unamended by this response.

In view of the amendments presented above and the following discussion, the Applicant respectfully submits that none of these claims now pending in the application are anticipated under the provisions of 35 U.S.C. § 102. Furthermore, the Applicants submit that all of these claims now satisfy the requirements of 35 U.S.C. § 112. Thus the Applicant believes that all of these claims are now in allowable form.

Objections**A. Drawings**

The Examiner objected to the Applicant's drawings because none of the figures shows that if data is previously recorded on a disk then error detection is determined, however, if no data is recorded on the disk then test recording is done to determine error.

In response to the Examiner's objections, the Applicant has removed from the claims the limitation that if no old data is recorded, then test data is recorded to determine if error is present. Having done so, the Applicant respectfully submits that the basis for the Examiner's objection of the Applicant's drawings has been removed. As such, the Applicant respectfully requests that the Examiner's objection of the Applicant's drawings be withdrawn.

Rejections**A. 35 U.S.C. § 112**

The Examiner rejected the Applicant's claims 1, 3-10, 12-21 and 23-24 under 35 U.S.C. § 112, first paragraph, as failing to comply with the written description requirement. The Examiner stated that the claims contain subject

Reply to Office Action dated: 3/18/05

Response dated: 07/08/05

**PATENT
PU010200**

matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventors at the time the application was filed had possession of the claimed invention. Specifically, the Examiner stated that the specification does not show or teach detecting error in the previously recorded data and if no old data is recorded, then recording test data to determine if error is present.

In response to the Examiner's rejection, the Applicant has removed from the claims the limitation that if no old data is recorded, then test data is recorded to determine if error is present. Having done so, the Applicant respectfully submits that the basis for the Examiner's rejection of the Applicant's claims has been removed. As such, the Applicant respectfully requests that the Examiner's 35 U.S.C. § 112, first paragraph, rejection of the Applicant's claims be withdrawn.

Therefore, the Applicant submit that claims 1, 3-10, 12-21 and 23-24, as they now stand, fully satisfy the requirements of 35 U.S.C. § 112 and are patentable thereunder.

The Applicant would like to take the opportunity herein to respond to the Examiner's previous 102 rejection

B. 35 U.S.C. § 102

The Examiner, in a previous final office action, rejected the Applicant's claims under 35 U.S.C. § 102(b) as being anticipated by Ohara et al. (U.S. Patent 6,317,831, hereinafter "Ohara"). The rejection is respectfully traversed.

The Examiner alleged in a previous office action that Ohara anticipates the Applicant's invention. The Applicant respectfully disagrees.

The Applicant respectfully submits that the Ohara reference fails to teach, suggest or disclose each and every element of at least the Applicant's invention as recited in at least the Applicant's amended, independent claim 1, which specifically recites:

"A method of detecting defects in a recordable optical storage medium, comprising the steps of:
accessing a portion of the recordable storage medium wherein new data is to be recorded; and
selectively examining data in said accessed portion for defects prior to recording said new data;

PATENT

PU010200

wherein if defects are detected in the data in said accessed portion, corrective measures are taken such that **the new data to be recorded is not recorded in said accessed portion having defects.**" (emphasis added).

The Applicant's invention is directed at least in part to a method and system for detecting defects in a recordable optical storage medium where at least a portion of the recordable storage medium in which new data is to be recorded is examined for defects. In one embodiment of the invention of the Applicant, if previously recorded data exists in the accessed portion, the old data is reproduced and examined for defects **prior to recording the new data.** In the invention of the Applicant, if the examined old data in the accessed portion of the storage medium exhibits defects, corrective measures are taken such that **the new data to be recorded is not recorded in said accessed portion having defects.** In support of the Applicant's invention, at least as claimed by the Applicant's amended claim 1 recited above, the Applicant in the Specification, specifically recites:

"Specifically, a segment of multimedia data that has been recorded onto a first portion of a recordable storage medium can be accessed, and the data can then be selectively examined to determine whether the first portion contains a defect. **The data that is examined can be data that has just been recorded during a current recording session or data that has been previously recorded and is being played back.** If a defect is detected, then a number of corrective measures can be taken including: generating a defect message; storing the address of the first portion of the recordable storage medium in a table; writing the segment of data onto a second portion of the recordable storage medium; and modifying the selectively examining step." (See Applicant's Specification, page 11, lines 4-13).

And

"In another arrangement, test data can be written onto at least a portion of the recordable storage medium **prior to or during the step of writing the actual data to be recorded onto that portion of the medium.** Specifically, a portion of the recordable storage medium can receive the test data. Once the test data is recorded onto the medium, the test data can then be selectively examined - similar to the examining process described above in step 214 - to determine whether the recording area contains one or more flaws." (See Applicant's Specification, page 16, lines 17-23).

The Applicant, in the Specification, further recites:

PU010200**

"If a defect is detected, then a defect message can be generated and/or the address of the portion of the recordable storage medium which contains the defect can be stored in a table for future reference, as discussed in step 222 of flowchart 200. Thus, a user can be made aware of the suitability of a storage medium's recording capability **prior to the actual recording.**" (See Applicant's Specification, page 17, lines 12-16).

And

"Specifically, **before a segment of actual data is written to a portion of the medium**, test data can be written to that portion of the medium and searched for errors. If the portion of the medium contains no defects, then the actual data can be recorded onto that portion of the medium and the process can continue.

If a defect is discovered, then one or more of the previously discussed corrective measures of step 222 of flowchart 200 can be performed. For example, a defect message can be generated and/or the address of the portion of the recordable storage medium which contains the defect can be stored in a table for future reference. Moreover, the test data can be recorded onto another area of the medium, and the test data can also be examined again to ensure that the new medium area receiving the test data contains no defects. **Once a suitable area has been located, the actual data can be recorded there**, and the process of alternately writing test and actual data can continue." (See Applicant's Specification, page 17, line 21 through page 18, line 9).

In support of at least the Applicant's amended claim 1, the Applicant specifically teaches, as clearly depicted by at least the portions of the Applicant's Specification depicted above, a method and system for detecting defects in a recordable optical storage medium including playing back multimedia data that has been recorded during a previous recording session to determine whether an accessed portion of the storage medium contains a defect and alternatively recording multimedia data (test data) and examining the multimedia data (test data) to determine whether the portion of the disc that the test data was written on contains defects all prior to recording the actual data. The Applicant specifically teaches that in one arrangement the test data is written to the medium prior to the recording of the actual data and that alternatively, the test data can be written to the medium during a recording session of the actual data but still prior to writing the actual data to a portion of the medium. That is, in at least the claimed invention of the Applicant at least with respect to claim 1, a portion of a medium wherein it is desired to write actual data is always tested prior to writing the actual data, **such that actual data to be recorded is not recorded in a portion of the medium having defects.** In

PATENT**PU010200**

the invention of the Applicant, the testing of the media for defects before actually attempting to record actual, desired content supports real time recording and recovery in a manner superior to that of Ohara.

More specifically, the Applicant respectfully submits that there is absolutely no teaching, suggestion or disclosure in Ohara for a method and system for detecting defects in a recordable optical storage medium including at least "selectively examining data in said accessed portion for defects **prior to recording said new data**" "wherein if defects are detected in the data in said accessed portion, corrective measures are taken **such that the new data to be recorded is not recorded in said accessed portion having defects**" as taught in the Applicant's Specification and claimed by at least the Applicant's amended claim 1 and amended claim 12.

Ohara teaches an information recording/reproducing apparatus and a method of recording data onto an information recording/reproducing media. In Ohara, the information recording/reproducing apparatus has the capability of handling the information recording/reproducing media both when they are not in a case and when they are in a case. A recording mode is selected basing on the determinations of (i) whether or not the recording/reproducing medium is a medium type which is necessarily contained in a case at recording and (ii) whether the case is present or absent. (See Ohara, Abstract).

In contrast to the invention of the Applicant, in Ohara, upon a history determining means detecting the absence of an identification member, a user is offered an option whether or not to perform a verification mode. If a user opts to perform the verification mode, a verification means verifies newly recorded information that is intended to remain on a disc. More specifically, Ohara specifically recites:

"Thus, since the user decide whether to perform the verification or not, a problem is solved that the recording speed is reduced by always performing the verification.

Step 4 (ST4): At this step, normal recording is performed by the recording means 35. When recording is completed, the operation is terminated without the verification being performed and the process waits for the next direction from the user.

Response dated: 07/08/05

**PATENT
PU010200**

Step 5 (ST5): The information the user intends to record is recorded by the recording means 35 and the process proceeds to step 6.

Step 6 (ST6): The verifying means 34 verifies the information recorded at step 5.

Specifically, (1) the area recorded just now is reproduced, and (2) simultaneously therewith, the error correcting circuit is actuated to check the number of errors." (See Ohara, col. 11, lines 7-22).

As evident from at least the portion of the disclosure of Ohara depicted above, Ohara specifically teaches away from the invention of the Applicant. More specifically, in Ohara actual desired data is written onto a recording medium and then the recorded actual data is reproduced and tested for errors. This is in direct contrast to the teachings and claims of the Applicant, wherein old data or test data in an accessed portion of a medium is reproduced and examined for defects, prior to recording actual data of interest onto the accessed portion of the medium. That is, there is absolutely no teaching, suggestion or disclosure in Ohara for at least "selectively examining data in said accessed portion for defects **prior to recording said new data**" "wherein if defects are detected in the data in said accessed portion, corrective measures are taken **such that the new data to be recorded is not recorded in said accessed portion having defects**" as taught in the Applicant's Specification and claimed by at least the Applicant's amended claim 1 and amended claim 12. Instead, in Ohara, upon a history determining means detecting the absence of an identification member, a user is offered an option whether or not to perform a verification mode. If a user opts to perform the verification mode, a verification means verifies newly recorded information that is intended to remain on a disc (i.e., not test data or previously recorded data examined before recording the new data that is intended to remain on a recordable storage medium as in the invention of the Applicant).

For at least the reasons described above, the Applicant respectfully submits that the teachings of Ohara fall far short of the Applicant's claimed invention, at least with respect to amended, independent claims 1 and 12.

As such and at least because the teachings of Ohara teach away from the invention of the Applicant and because Ohara fails to teach, suggest or disclose at least "selectively examining data in said accessed portion for defects **prior to recording said new data**" "wherein if defects are detected in the data in said

CUSTOMER NO.: 24498

**PATENT
PU010200**

accessed portion, corrective measures are taken such that the new data to be recorded is not recorded in said accessed portion having defects" as taught in the Applicant's Specification and claimed by at least the Applicant's amended claim 1, the Applicant respectfully submits that the teachings and disclosure of Ohara do not teach each and every element of the Applicant's claimed invention, arranged as in the claim, and as such, Ohara does not anticipate the Applicant's invention, at least with respect to amended, independent claim 1.

Therefore, the Applicant submits that for at least the reasons recited above amended, independent claim 1 is not anticipated by the teachings of Ohara and, as such, fully satisfies the requirements of 35 U.S.C. § 102 and is patentable thereunder.

Likewise, amended, independent claim 12 recites similar relevant features as recited in the Applicant's independent claim 1. As such, the Applicant submits that for at least the reasons recited above, Independent claim 12 is also not anticipated by the teachings of Ohara and also fully satisfies the requirements of 35 U.S.C. § 102 and is patentable thereunder.

Furthermore, dependent claims 3-10, 13-21 and 23-28 depend either directly or indirectly from independent claims 1 and 12 and recite additional features therefor. As such and for at least the reasons set forth herein, the Applicant submits that dependent claims 3-10, 13-21 and 23-28 are also not anticipated by the teachings of Ohara. Therefore the Applicant submits that dependent claims 3-10, 13-21 and 23-28 also fully satisfy the requirements of 35 U.S.C. § 102 and are patentable thereunder.

The Applicant reserves the right to establish the patentability of each of the claims individually in subsequent prosecution.

Conclusion

Thus the Applicant submits that none of the claims, presently in the application, are anticipated under the provisions of 35 U.S.C. § 102. Furthermore, the Applicant submits that all of these claims now fully satisfy the requirements of 35 U.S.C. § 112. Consequently, the Applicant believes that all these claims are presently in condition for allowance. Accordingly, both reconsideration of this application and its swift passage to issue are earnestly solicited.
